

THE TRACK ROLLERS BEARING

TRACK ROLLERS BEARING

Have you met any following conditions regarding bearings & its neighboring parts?

Heavy noise

Frequent failures

Overheating of operation

Shorter service life

**Do you want to find out the causes and
get effective solutions?**

THB can help you do that.

**THB's specialized
technical services for
various applications **include****

DESIGN SELECTION

Application analysis

To understand the difficulties in the transmission system; to prevent clients from potential problems in equipment design or operation.

Product selection

To provide advices for selecting optimal bearing, in order to match clients' design requirements based on application characteristics.

Application of special technologies

Depending on the application, special technologies (e.g., special coatings) will be selected to adapt to client's extreme working condition.

Customizing bearing units products

To customize the complete mechanical unit, including bearings. Which can benefit both operation precision and assembly efficiency for clients.

Optimization of design

Through analysis and optimization of the existing transmission design, enable the equipment to run faster at less energy consumption, as well as increasing reliability.

STATUS ANALYSIS

Performance Test

To use simulation software analysis and actual testing of the test machine to determine whether the bearings and its surrounding components could meet the requirements of the client (load, speed, temperature rise, noise and service life).

Failure analysis

To analyze the materials, geometrical accuracy, surface damage and microstructure to identify the cause of any failure and then to provide an effective solution timely.

Lubrication analysis and management

To analyze the equipment operation status and determine the lubrication management plan, including the selection of lubricants; lubricants application method and optimal lubrication cycle. Thus, it may help optimize the maintenance plan and improve the equipment efficiency.

AFTER SALES SERVICES

Bearing application training

To provide clients with professional training in product selection, application technologies, installation and maintenance to help them improve their competitiveness.

Industrial bearing remanufacturing

To provide diagnostic and effective remanufacturing services for heavy-duty, high-value products with long production cycles to extend bearing life and reduce costs.

Maintenance solutions

Based on the characteristics of the industry and equipment operation, we can provide targeted maintenance and upgrade solutions to aid concern identification and improve equipment performance at an early stage.

Who is THB

problems.

THB-
a Chinese craftsman
who provides clients
with high quality
products, focusing on
bearing manufacturing
processes and bearing
quality control.

**THB is your technical advisor
and business partner for various applications.**

Overview

THB track rollers bearing is categorized into different types, including the yoke type track rollers, stud type track rollers, ball bearing track rollers, combined bearings and other specific roller bearings. Track rollers bearing has the thick-walled outer ring, which can not only withstand high radial loads, but also reduce deformation and bending stress. Such bearing is particularly suitable for use with cam drives and conveyor lines where the outer rings shall be rolled.

The outer ring surface of a THB track rollers bearing is typically configured as convex profile, which can reduce the shortening of bearing life due to the tilt of mounting surface and track to a certain extent, and can reduce the generation of track rollers bearing edge stress, thus benefiting the extended service life of the track rollers bearing and track.

THB, remaining committed to the customer first principle, endeavors to provide customers with the best product solutions. In addition to the standard rollers, we can also provide clients with coated long-life roller bearings, maintenance-free roller bearings with plastic state oil lubrication (including food-grade product) and anti-corrosion stainless steel track rollers bearing to meet the needs of our clients in different scenarios.

Yoke Type Track Rollers

THB yoke type track rollers have thick outer rings with needle rollers or cylindrical rollers, which are mainly used in such applications as cam drives, bed guide rails, conveyors and linear guideway systems.

Yoke type track rollers can withstand high radial loads, and those with a convex crown profile on the outer surface generatrix can also withstand axial loads caused by minor misalignment defects, skewed running or short-term shocks.

Yoke type track rollers have structures with or without outer ring axial guides, or have structure with seals on both sides, or have an open structure. With an optimized convex crown profile on the outer surface of the outer ring, these bearings have a smaller Hertzian stress, conducive to reducing edge stress in tilted conditions, and reducing wear on the bearing track and extending the service life of the bearing tracks as well.

Yoke type track rollers are installed on shafts or bolts, which are available in types with or without inner rings.

Stud Type Track Rollers

The stud type track roller is designed in the same way as the yoke type track roller with axial guide, in which the needle rollers or cylindrical rollers are used as its rolling element, and the inner ring is replaced with the supporting bolt. The bolt shaft has installation threads and both ends have inner hexagonal holes and re-lubrication circuit in the shaft. There are also rollers with tight-fitting eccentric locking collar. With the eccentric locking collar, the outer ring surface can be adjusted to achieve the most suitable contact with the adjacent structural supporting track.

Stud type track rollers of labyrinth seal type, gap type or contact seal type, etc. are available, which are sealed with metal, reinforced nylon, and nitrile rubber, etc.

The outer surface generatrix of the outer ring has a convex crown profile, which can withstand axial loads caused by minor misalignment defects, skewed running or short term shocks. When running on supporting tracks, the bearings have a smaller Hertzian stress, conducive to reducing edge stress in tilted conditions, and reducing wear on the bearing track and extending the service life of the bearing tracks as well.

Ball Bearing Track Rollers

Ball bearing track rollers have the same design as deep groove ball bearings or angular contact ball bearings, but have thicker outer rings and convex coronal profile on the outer surface.

They can withstand high radial loads and bi-directional axial loads. Such bearings are properly enclosed.

Ball bearing track rollers with or without bolts are available.

Rollers without bolts shall be installed on shafts or bolts.

Combined Bearings

THB combined bearings is a bearing unit consisting of an axial roller bearing and a radial roller bearing. Combined bearings characteristics small bearing, easy assembly by means of bolt welding and low comprehensive manufacturing costs.

Combined bearings are properly sized to sustain large radial and axial loads and the related parts are easy to replace.

THB's optimized internal structural design allows for uniform distribution of the mechanism's load-bearing capacity over the supporting track.

Such bearings are mainly used in various gantry lifting systems, conveyors and other applications.

Other Specific Track Rollers Bearing

THB Stainless Steel Track Rollers Bearing

THB stainless steel track rollers bearing is made of high quality 440C or 420 stainless steel, in which the rolling element, outer ring and inner ring (shaft) are all made of stainless steel so that it can provide sufficiently high bearing load capacity and effectively prevent corrosion as well. Such bearings are mainly used in food, medical, special industries and other areas requiring adequate corrosion resistance.

SLB	Female thread used for connection of bolt shaft end					

Model system of THB roller bearing (CF inch series)

Bearing's basic model

Product Description - Yoke Type Track Rollers

Structural characteristics

Yoke type track rollers are single- or double-row bearing units mounted on a shaft or bolt. They consist of thick outer rings with a specific outer surface shape and needle roller-retainer assembly or full complement needle roller or full complement cylindrical roller assemblies. The outer ring has a crowned trimmed or cylindrical surface.

Yoke Type Track Rollers with crowned modified outer surface can withstand high radial loads and axial forces caused by slight misalignment and skewed operation. These bearings are suitable for applications such as cam drives, bed rails and conveyors, etc.

Yoke type track rollers with or without inner rings, or with seals on both sides, or with an open structure are available.

Outer surface profile of outer ring

Yoke Type Track Rollers with a crowned modified outer surface are widely used to avoid edge stress caused by the inclination of the outer surface of the roller relative to the movement of the supporting track. The outer ring bearing (bearing suffix X) with cylindrical outer surface is also available as required by clients.

The outer surface curvature radius of yoke type track roller is generally $R=500\text{mm}$. For the outer surface curvature of roller NNTR series, please refer to the attached parameter sheet.

Yoke Type Track Rollers without inner rings

The RSTO and RNA series of Yoke Type Track Rollers do not have inner rings. They are particularly compact, but the surfaces of the shafts or bolts used as raceway shall be hardened and ground.

The RSTO series are detachable. The outer ring, needle roller and cage assemblies, and inner ring can be installed independently.

For the RST and RNA series, the rollers are retainer guided. They do not have axial guidance function. The axial guidance of the outer ring as well as the needle roller and cage assembly must be provided by adjacent components. See Page 20 for details on the design of adjacent structures for track rollers bearing

RSTO

RNA

Product Description - Yoke Type Track Rollers

Yoke type track rollers with inner rings

The roller STO and NA series are of the detachable structure. For STO series, the outer ring needle roller and cage assembly and inner ring can be installed separately. For NA series, the outer ring needle is an integral part of the cage assembly so that it may be separately assembled with the inner ring. STO, NA, NATR series have retainers.

The outer rings of STO and NA series do not have axial guidance function.

NATV series have full complement needle roller assembly and track rollers bearing. NUTR, PWTR and NNTR series have full complement cylindrical roller assembly.

NATR, NATV, NUTR, PWTR and NNTR series have axial guidance function, and can withstand certain axial forces.

Yoke type track rollers without retainers have as many rolling elements as possible to sustain high loads. Due to the increased internal frictional resistance, such yoke type track rollers can achieve speeds slightly lower than those of yoke type track rollers with retainer guidance.

Sealing	Among the Yoke Type Track Rollers, except for the STO series in open structure without sealing, the other series have different sealing structures depending on the product series. See the parameter sheet for the sealing types.
Lubrication	Prior to delivery, the yoke type track rollers have been filled with lithium-based grease so that they can be re-lubricated through the inner ring or using equivalent grease. For special lubrication materials, please contact THB technical department.
Working temperature	The yoke type track rollers can operate at temperature of -30 °C to +140 °C. For the bearings with seals (suffix 2RS and 2RSR) and nylon retainers (suffix TV), the working temperature is within -30°C to +120 °C. Due to restriction on the selected grease and seal materials, NATR... -PP and NATV... -PP are suitable for use under the working temperature of -30 °C to +100 °C. If you need special products beyond the standard working temperature, please contact THB technical department.

Product Description - Stud Type Track Rollers

Structural characteristics

The stud type track rollers are similar to the yoke type track rollers in structure, and the inner raceway is replaced with the support bolt with fixed thread and lubrication hole. Given the specific surface shape and the thickened outer ring, stud type track rollers can bear high radial load as well as axial force generated by slight misalignment and skewed movement. The stud type track rollers are available in various designs with or without eccentric bushing. Such bearings are particularly suitable for applications such as cam drives, bed guides and conveyors.

The basic rating life of the PWKR series has been significantly improved as a result of the improved materials and optimized raceway shape. The static and dynamic load carrying capacity has also been improved. The optimized profile and improve surface quality of the rollers have reduced the stress of the rollers and rails supporting the track, realizing the solid bearing configuration and long service life.

Outer surface profile of outer ring

Stud type track rollers with a crowned modified outer surface are widely used to avoid edge stresses caused by the inclination of the outer surface of the roller relative to the movement of the supporting track.

The curvature radius of the KR series is $R=500\text{mm}$.

The other series products have the outer ring profile derived from K1S optimization.

The stud type track rollers with such curvature profile shape have the following features:

1. Low Hertzian stress
2. Low edge stress during inclined operation
3. Small wearing of the support track
4. Extended service life of the support track
5. Stud type track rollers with or without eccentric locking collar available

Stud type track rollers with retainers

KR and KRE series have needle roller retainer assemblies, and higher limit rotation speed. The KRE series have tight fitting eccentric locking collar at the shaft neck to facilitate the adjustment of position relative to the mechanism track.

KR

KRE..-PP

Stud type track rollers with full complement needle rollers or cylindrical rollers

KRV series bearings are available in full complement needle rollers and NUKR and PWKR series are available in full complement cylindrical rollers. The retainer-free bolt roller fully filled with roller needles or cylindrical rollers is highly loaded due to accommodation of more rolling elements. However, due to the increased frictional resistance, the limit speed of these bearings is slightly lower than that of stud type track rollers with retainer guidance.

The NUKRE and PWKRE series have tight fitting eccentric locking collar at the shaft neck to facilitate the adjustment of position relative to the track.

Axial guidance method

For KR and KRV series, the axial guidance of rollers is realized using contact retaining edges and contact washers. The axial guidance of NUKR and PWKR series is realized through rolling elements and ribs.

Stud-type track rollers with eccentric locking collars

The rollers with eccentric locking collars can be adjusted by means of hexagonal holes on the flange side or on the threaded end. It is possible to adjust the relative position of the outer contour surface of the outer ring and the support raceway, which also allows the appropriate reduction of manufacturing accuracy of the adjacent structure. When multiple stud type track rollers are used simultaneously, load distribution can also be improved, making it easy to implement a linear guidance system with pre-load.

The position of the highest point of the eccentric locking collar is marked on the end face of the bolt and the eccentric distance e is indicated in the dimension table. This is also the location of the radial re-lubrication hole, which should be located in the non-load area of the rolling contact. The eccentric locking collar covers the radial lubrication hole in the bolt. Therefore, re-lubrication must be carried out through the end face.

KRV

NUKR

PWKR

NUKRE

PWKRE

Product Description - Stud Type Track Rollers

Sealing	Stud type track rollers are sealed on both sides. Different sealing structures can be provided according to the different configurations of the product series. See the parameter sheet for the sealing types.
Lubrication	At the factory, the stud type track rollers bearings are filled with lithium-based grease and can be re-lubricated through the specific bolt shaft oil hole using equivalent grease. For special lubrication materials, please contact THB technical department.
Working temperature	<p>The working temperature of the track rollers bearing is -30°C to +140°C. For the bearings with seals (suffix 2RS), the working temperature is from -30°C to +120°C.</p> <p>Due to restriction on the grease and seal materials, the stud type track rollers KR, KRV and KRE series are suitable for the working temperature of -30°C to +100°C.</p>

Product Description - Ball bearing track rollers

Structural characteristics Ball bearing track rollers are non-separable, single-row or double-row ball bearings with thick outer rings. In addition to withstanding very high radial loads, these bearings can also withstand axial forces in both directions. The outer ring has a crowned trimmed or cylindrical surface. The crowned and modified outer surface is designed for applications where the rollers are inclined relative to the support track and edge stresses must be avoided. Ball bearing track rollers are available with inner rings, support bolts and plastic cover on the outer ring.

Outer surface profile of outer ring The curvature radius of the ball bearing track rollers and stud type track rollers with crowned and modified profile surface is $R=500\text{mm}$. The suffix of track rollers bearing with cylindrical outer surface is X.

Ball bearing track rollers Ball bearing track rollers consist of outer rings with a crowned and modified or cylindrical outer surfaces, inner rings, balls and nylon retainer assemblies. They are similar to the deep groove ball bearings and angular contact ball bearings in structure, and may be installed on shafts or bolts. LR6, LR60 and LR2 support type ball bearing rollers are single row units and LR50, LR52 and LR53 are double row units.

LR6, LR60, LR2

LR50, LR52, LR53

Sealing Ball bearing track rollers are sealed on both sides. Different sealing structures can be provided according to the different configurations of the product series. See the parameter sheet for the sealing types.

Lubrication THB Ball bearing track rollers are filled with lithium-based grease at factory. In some cases, double-row ball rollers can also be re-lubricated through lubricating holes in the inner bore surface. For special lubrication materials, please contact THB technical department.

Working temperature Due to restrictions on the grease, retainer materials and seal materials, ball bearing track rollers are suitable for the working temperature of -20°C to $+120^{\circ}\text{C}$.

Design and Use

Yoke type track rollers, stud type track rollers

Principle of selecting yoke type track rollers and stud type track rollers

Both yoke type track rollers and stud type track rollers have thick outer rings to withstand the higher radial loads. If these rollers are used to support tracks in a plane, since the outer ring is subject to rotation and force during the movement, the rollers will be subject to certain elastic deformation. Compared to rolling bearings mounted in the block bore, rollers have the following characteristics:

1. Based on the working characteristics of track rollers bearings with rotating outer rings, the modified effective basic rated loads C_{rw} and C_{orw} are used, and they are the determining factors to be considered in calculating the roller service life.
2. Refer to the bending stress of the outer ring. The permissible radial load $F_{r\ per}$ (dynamic) and $F_{0r\ per}$ (static) bending stress of the track rollers bearing is not allowed to exceed the permitted strength of the material.

Permissible radial load under dynamic loading

For track rollers bearings with rotating outer rings subject to dynamic loads, the effective dynamic load rating C_{rw} is used to calculate the basic rating life. The radial dynamic load shall not exceed the permissible radial dynamic load $F_{r\ per}$. If $F_{r\ per}$ is not provided, use the effective rated dynamic load C_{rw} instead. If the effective rated static load C_{orw} is lower than the effective rated dynamic load C_{rw} , C_{orw} shall be used instead.

Permissible radial load under static loading

For track rollers bearings that are stationary or have only little rotational movement, it is equivalent to the track rollers bearings subject to static loads, and the effective static load rating C_{orw} shall be used to calculate the static load safety factor S_0 . It is not allowed to exceed the permissible radial static load $F_{0r\ per}$. If $F_{0r\ per}$ is not provided, the effective rated static load C_{orw} shall be used instead. The radial load acting on the bearing shall not exceed this value. In addition to the permissible radial static load, the permissible radial load of the supporting rail must also be considered.

Load-bearing capacity and life cycle

The methods of calculating rating life are as follows:
Calculation of basic rating life according to DIN ISO 281
Calculation of corrected rating life according to DIN ISO 281
Use of the expanded calculation method for corrected reference service life in accordance with DIN ISO 281-4
Please contact THB technical department if needed.
For yoke type track rollers, stud type track rollers and ball bearing track rollers, the following values must be replaced:
 $C_r, C_{0r} = C_{rw}, C_{orw}$
Effective rated dynamic load or static load
 $C_{ur} = C_{urw}$
Please refer to the fatigue limit load of the rollers in the dimension table.

Other formulas for calculating the basic rating service life

$$L_s = 0.0314 \cdot D \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

or

$$L_h = 26.18 \cdot \frac{D}{H \cdot n_{osc}} \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

or

$$L_h = 52.36 \cdot \frac{D}{v} \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

L_s 10^5 m

basic rating life, 10^5 m

L_h h

basic rating life, unit: hours

C_{rw} N

C_{rw} N

C_{rw} is the load of constant intensity and direction, under which a set of sufficient identical track rollers bearings can achieve a basic rating life per one million revolutions.

P_r N

Equivalent dynamic load (radial load)

P-life index:

$P = 3$, for support and stud type track rollers with ball rolling elements.

$P = 10/3$, for support and stud type track rollers with needle rollers or cylindrical rollers

n min^{-1} running speed

D mm

Roller outer diameter

H m

Individual stroke for reciprocating motion

nose min^{-1}

Number of reciprocations per minute

v m/min Average running speed.

Design and Use

Yoke type track rollers and stud type track rollers

Service life

Service life is the actual life of the roller bearing. It is calculated in a way much different from that of the basic rating life.

This is due to the wearing or fatigue caused by the following factors:

1. The working conditions are different from those under which the rating life is calculated
2. The roller is out of alignment with respect to the support track during operation
3. Working clearance is too small or too large
4. Rollers are contaminated
5. Inadequate lubrication
6. The working temperature is too high
7. The bearing oscillates at a very small angle, resulting in Pseudo Brinell indentation
8. Wearing between the outer surface of the outer ring and the support track
9. Serious vibrations and Pseudo Brinell indentation
10. Shock load is extremely large and the static load is too large
11. Early damage to roller parts caused by improper installation.

Due to the diversity of installation and working conditions, it is impossible to determine the service life precisely in advance.

The most reliable method is to obtain a life estimate that is close to the actual life by comparing with working conditions in similar applications.

Static load safety factor

The static load safety factor S_0 is a safety assessment criterion for bearings to avoid permanent deformation:

$$S_0 = \frac{C_{0r w}}{F_{0r}}$$

S_0	–
Static load safety factor	
$C_{0r w}$	N
Effective rated static loads, See dimension table	
F_{0r}	N
Maximum radial static load on rollers	

When the static load safety factor $S_0 < 8$, the roller is considered to be subject to a high load.

When the static load safety factor $S_0 < 1$, plastic deformation of the roller and raceway will be caused, which will compromise the operation stability.

This case is only allowed for bearings in applications where there is only little rotational movement or where the bearings are less important.

If the static load safety factor $S_0 < 2$, please contact THB technical department.

Minimum load

To ensure that the normal rotation of the outer ring of the track rollers bearing without sliding, or to prevent the roller from running out of the support track during operation, the roller must be subject to a minimum load in its dynamic operation. In general, $C_{0rw}/F_r < 60$ is used to calculate the minimum load.

Skew movement

The skew movement will generate additional axial force on the bearing and cause axial sliding at the rolling contact between the outer ring and the support track. Whether wear occurs depends on the skew angle and the lubrication state of the friction area.

Text on image: The adhesion friction between the outer ring and the track is completely lost, accompanied by severe wearing. When the skew angle $\alpha \geq 1.4 \cdot 10^{-4} \cdot \text{pH}(\text{°})$ or $\alpha \geq 2.5 \cdot 10^{-3} \cdot \text{pH}$ (mrad), the adhesive friction between the outer ring and the track is completely lost, resulting in severe wearing.

If tilting occurs during motion, there will be an increase in edge stress, especially for rollers with cylindrical outer rings. Rollers with a crowned modified outer rings are less sensitive to tilting, which should be preferably used. It has been proved that cylindrical outer ring $\beta > 0.1^\circ$ (1.7mrad) and crowned outer ring $\beta > 0.25^\circ$ (4.4mrad) is prone to damage.

Rotation speed

The permissible maximum speed of a track rollers bearing is mainly determined by its working temperature. The working temperature depends on factors such as the bearing type, load, lubrication conditions and cooling conditions, etc..

Rotation speed during continuous operation

The speed n_{DG} in the dimension table is used for reference. They are determined by the following conditions: Grease lubrication
 Load for continuous operation $< 0.05 \cdot C_{0rw}$
 Skew movement angle $\alpha < 0.03^\circ$ (< 0.5 mrad)
 Ambient temperature $+20^\circ\text{C}$
 Outer ring temperature $+70^\circ\text{C}$
 Lubricated support track and bearing outer profile surface are free of external axial loads.
 Under the following working conditions, the rotation speed must be reduced:
 Load $> 0.05 \cdot C_{0rw}$
 Poor heat dissipation caused by additional axial load (skew movement)
 Higher speed can be achieved with intermittent operation and pulse oil lubrication.

Design and Use

Yoke type track rollers and stud type track rollers

Rotation speed of track rollers bearing with contact seals

The speed of a track rollers bearing with contact seal is also limited by the permissible sliding speed of the seal lip.

Friction torque

The friction torque M_R of a track rollers bearing depends on many factors, such as load, speed and roller type, as well as lubrication and seal friction. Due to the wide range of these factors, the simulated calculation of the friction torque is only for reference. For rollers without contact seals, the following formula is used to calculate the friction torque under normal working conditions and at medium speed:

$$M_R = f \cdot F_r \cdot \frac{d_M}{2}$$

M_R Nmm
Friction torque of the track rollers bearing
 f –
friction torque coefficient, see the following table
 F_r N
Radial load
 d_M mm
Average diameter of the roller bearing

The values of the friction torque coefficient f in the table are suitable for track rollers bearing without seals subject to radial loads.

Higher values will be required for track rollers bearing with seals. Given additional axial loads caused by, for example, large skew, significant increase in these values is expected, especially for needle rollers. Ball bearing track rollers can withstand a certain axial force with the friction torque not significantly varied.

Friction coefficient f

Track rollers type	Coefficient f
Ball bearings, single-row	0.0015 to 0.002
Ball bearings, double-row	0.002 to 0.003
Cylindrical roller bearings, fully loaded	0.002 to 0.003
Needle roller bearings with retainers	0.003 to 0.004
Needle roller bearings, fully loaded	0.005 to 0.007

Resistance to movement

When a track rollers bearing rolls on track, it must overcome not only the friction inside the bearing, but also the friction between the outer ring and the track. The resistance to movement, F_v , is determined by the following equation:

$$F_v = \frac{2 \cdot (f_R \cdot F_r + M_R)}{D}$$

F_v N
Resistance to movement
 f_R mm
Rolling friction data for hardened steel support track:
 $f_R = 0.05$ mm
 F_r N
Radial load
 M_R Nmm
Friction torque of track rollers bearing
 D mm
Roller outer diameter

Two contact areas in the track rollers bearing

The two contact areas in the track rollers bearing must be lubricated separately for:
1. Rolling elements and raceway
2. The outer surface of the track rollers bearing and the support track.

Lubrication of bearings

For the yoke type track rollers and stud type track rollers based on needle rollers and cylindrical rollers, lithium-based soap complex mineral oil grease with EP additives shall be used.

Recommended grease for re-lubrication

Arcanol grease	Designation to DIN 51825	Type of grease	Tack roller
LOAD150	KP2N-20	Lithium soap grease with mineral oil base	Yoke and stud type track rollers based on rollers
LOAD220	KP2N-20	Lithium-calcium soap grease with mineral oil base	Yoke and stud type track rollers based on rollers
MULTI3	KP3K-30	Lithium soap grease with mineral oil base	Yoke and stud type track rollers based on balls

Lubrication of track rollers bearing

For the yoke type track rollers and stud type track rollers based on needle rollers and cylindrical rollers, lithium-based soap complex mineral oil grease with EP additives shall be used.

If the contact area cannot be lubricated, wear is bound to occur, especially under heavy-duty and high-speed working conditions.

Oil lubrication

For oil lubrication, it is recommended to use CLP type lubricants according to DIN 51517.

Grease lubrication

For grease lubrication, lithium soap-based greases according to DIN 51825 should be used. The re-lubrication interval shall be determined based on working conditions. Re-lubrication must be carried out at least when frictional corrosion first appears, which can be identified by the appearance of red color at the support track or outer ring.

Design and Use

Yoke type track rollers and stud type track rollers

Centralized lubrication of stud type track rollers

For stud type track rollers, if the centralized lubrication system is used, the lubrication joint and the standard bolt with hexagonal holes at both ends of the stud type track rollers shall be used for connection (as illustrated below). It has a hexagonal head adapter and a quick connect fitting.

Re-lubrication intervals for re-lubrication interval calculation

The stud type track rollers must be re-lubricated periodically during its operation at the re-lubrication interval (refer to the following table).

Load ratio C_{0rw}/P_r	Maximum working speed n_{max} , n_{DG} percentage			
	10	25	50	
$5 > C_{0rw}/P_r \geq 3$	0.5 year	-	-	-
$10 > C_{0rw}/P_r \geq 5$	Every year	4 months	Every month	-
$C_{0rw}/P_r \geq 10$	Every year	8 months	2 months	14 days

The unused lubrication holes of stud type track rollers must be closed with the funnel-shaped grease nipples or plugs provided.

Adjacent structure of yoke type track rollers

For yoke type track rollers without inner rings, the track surface on the shaft or bolt must be hardened and ground (see the table below for specific requirements). The surface hardness of 670 HV + 170 HV must be assured, providing sufficient hardening depth CHD or SHD.

Tolerances and surface quality of shaft or bolt tracks

Diameter tolerance of shaft or bolt		Roughness	Roundness	Parallelism
Without inner ring	With inner ring	max.	max.	max.
k5	g6 (point load)	Ra0.4 (Rz2)	25% of the diameter tolerance	50% of the diameter tolerance

Positioning of yoke type track rollers without axial guidance

For yoke type track rollers without axial guidance, the outer ring and the needle roller and cage assembly must have lateral guidance (as illustrated below).

The surfaces in axial contact with the outer ring must be properly machined (Ra2 recommended), which shall be wear-resistant and lubricated.

The yoke type track rollers without axial guidance are separable.

The outer ring shall match with the needle roller and cage assembly, and must not be interchanged with other bearing parts of the same size during installation.

The tolerance of the inner circle of the roller mating with the inner ring is F6, and can be interchanged within the same accuracy class.

RSTO type

As shown in the figure: lateral guidance of the outer ring and needle roller and cage assembly

Design and Use

Yoke type track rollers and stud type track rollers

Positioning of yoke type track rollers bearing with axial guidance

Yoke type track rollers with axial guidance must be axially clamped in position. If there is an axial load, the axial washer must be adequately supported axially. The values of dimension d_2 in the dimension table must be strictly followed. Yoke type track rollers NATR and NATV can be positioned with conventional fasteners such as snap rings.

NATR

① Snap ring

d_2 =adjacent structure diameter

As shown in the figure

Using snap ring for positioning

PWTR...-2RS

As shown in the figure

Clamping of inner ring

and axial washer

For NNTR... -2ZL, NUTR, PWTR... -2RS, the inner ring and axial washer must be axially located.

Adjacent structure of stud type track rollers

Since the tolerance of the bolt shaft without eccentric locking collar is $h7$ and the tolerance of the bolt shaft with eccentric locking collar is $h9$, the fit with the hole of tolerance $H7$ is a clearance fit.

The positioning surface of the stud type track rollers must be flat, vertical and of sufficiently tall. The strength of the nut positioning surface must be high enough. The dimension shall not be smaller than d_2 in the dimension table.

The entrance end of the positioning hole should not be chamfered by more than $0.5 \times 45^\circ$.

Axial location

Hexagonal nuts must be used to axially fasten the stud type track rollers. In case of severe vibration, the stud type track rollers shall be positioned using self-locking nuts or special locking washers according to DIN 985.

For self-locking nuts, high locking torque is required and the nut manufacturer's recommendations must be observed.

Positions of lubrication holes

The position of the radial lubrication hole is at the flange end of the bolt, which must not be in the load area.

NUKR

① Mark

As shown in the figure

Positions of lubrication holes

Protection of the support track

The support track should be protected from contamination. If necessary, a protective cover or a wiper preferably made of felt should be placed in front of the rollers.

① Dust cover

As shown in the figure

Protection of the support track from contamination

Installation

Track rollers bearing are precision mechanical components. These products must be properly handled before and during installation. Trouble-free operation can be assured should installation be conducted properly.

The product must be protected from dust, contaminants and moisture. Contaminants can impair the operating performance and working life of bearings.

Do not overcool the bearings. Moisture from condensation can lead to corrosion of bearing and its blocks. The yoke type track rollers RSTO and STO are detachable. The outer ring shall match with the needle roller and cage assembly, and must not be interchanged with other bearing parts of the same size during installation.

The installation area must be kept clean without any dust. Check the dimensional and geometric accuracy and cleanliness of the mating surfaces.

The bearing block surface shall be coated with a little lubricant or rubbed with solid lubricant.

The bearing must be filled with lubricant after installation. Finally, check if bearings are correctly assembled for normal operation.

Design and Use

Installation tools

Depending on applications, the following tools can be used for installation:

1. Induction heaters;
2. Heating box; heating temperature to +80°C
3. Mechanical or hydraulic devices; using a mounting sleeve covering the entire circumference of the bearing collar end face
4. Hammer and mounting sleeve; hammer on the entire annular surface of the mounting sleeve

The mounting force shall not be transferred through the rollers. Direct hammering on the bearing rings must be avoided.

To ensure the seals are not damaged during installation. For stud type track rollers bearings, the flange surface should not be hammered directly. Instead, a special installation tool that can cover the entire flange surface should be used.

Disassembly guide

Due consideration shall be given to bearing disassembly at the preliminary design of bearing arrangement. If bearings will be used again:

1. Do not directly hit on the bearing rings
2. Do not transfer the disassembly force through the rolling elements
3. Clean the bearings thoroughly after disassembly

Installation and disassembly of track rollers bearing (needle rollers and cylindrical rollers)

If the tolerance is not favorable for installation, press-fit equipment should be used to press the track rollers bearing onto the shaft or stud. When installing the inner ring, care should be taken that the press-fit force is evenly distributed on the end face of the inner ring.

Lubrication holes

When installing bearings, the lubrication holes shall be arranged in the non-loading areas.

For yoke type track rollers PWTR and NNTR, it is not necessary to specify the lubrication hole installation.

NUTR

① Press fitting equipment
As shown in the figure
Press-fitting equipment shall be used to press-fit the yoke type track rollers

Axial location

The yoke type track rollers NUTR, PWTR and NNTR must be axially located.

PWTR..-2RS

① Hexagonal nuts
Axial location as shown
in the figure

Installation and disassembly of
stud type track rollers (needle
rollers and cylindrical rollers)

If possible, stud type track rollers should be installed using press-fitting
equipment.

Do not hit the flange of the support bolt.
The radial lubrication hole is located on the flange end of the bolt.
This location shall not be placed in the load-carrying area.

Design and Use

Press-fit lube nozzle for stud type track rollers

The press-fit lube nozzle is provided along with the stud type track rollers in independent packages, which shall be press into the bearing correctly before installing the bearing.

KR..-PP
As shown in the figure

Only the lube nozzle provided can be used (as shown in the table). If re-lubrication is carried out through the positioning hole, the axial lubrication hole of the stud type track rollers must be sealed with a lubrication nipple before installation.

Dimensions of stud type track rollers and press-fit core shaft with press-fit lubrication nipple

Press-fit lubrication nipple

lubrication nipple	Dimension mm						Applicable outer diameter D
	D	d	L	h	ds ±0.1	L _s	
NIPA1	6	4	6	1.5	-	-	16 and 19
NIPA1X4.5	4.7	4	4.5	1	4.5	5	22 to 32
NIPA1X7.5	7.5	6	7.5	2	7.5	6	35 to 52
NIPA3X9.5	10	8	9.5	3	10	9	62 to 90

For the length of lubrication nipple projection, please see the dimension table.

Axial location of stud type track rollers

Hexagonal nuts must be used to axially protect the stud type track rollers. When tightening the mounting nut or adjusting the eccentric locking collar, you can use a hexagonal wrench to hold the bearing at the long slot or hexagonal hole at the end of the support bolt. In case of severe vibrations, self-locking nuts or special locking washers according to DIN 985 can be used.

① Hexagonal wrench
As shown in the figure
Rolling stud type track rollers with eccentric locking collar by holding the bearing with hexagonal wrench

The highest point of the eccentric locking collar is marked on one side of the bolt flange.

Initial operation and re-lubrication

stud type track rollers has a lubrication hole for re-lubrication:

1. At one side of the flange of the support bolt
2. At the end of the thread side, with the outer diameter starting from 22mm
3. On the handle of the support bolt, with the outer diameter starting from 30mm, and the lubrication slot in place.

Stud type track rollers with eccentric locking collars shall not be re-lubricated through bolts. The eccentric locking collar covers the lubrication hole. For lubrication, only the grease gun with the opening angle of $\leq 60^\circ$ and with needle point nozzle could be used. Before the initial operation, the lubrication holes and greasing tubes shall be filled with grease for anti-corrosion and lubrication.

If a rolling element is fixed on the Radial lubrication hole, it will be difficult to lubricate. For safety, re-lubrication shall be carried out after the running of the bearing while it is still releasing heat and rotating, or before the bearing stops running or prolonging the running interval. The grease used initially must be refilled for re-lubrication. Before using different grease, its miscibility and compatibility must be checked.

The re-lubrication shall be continued until new grease is seen at the seal gaps. The used grease must be able to flow out of the bearing without trouble.

- ① Needle point nozzle with the opening angle of $\leq 60^\circ$
As shown in the figure
Using grease gun for re-lubrication

Accuracy

The dimensional and geometrical tolerances shall be in accordance with DIN 620 and the standard bearings are Class PN, KR(E) and KRV shall be in accordance with ISO 7063.

The following deviations in DIN 620 shall be used:

1. The diameter tolerance of the optimized outer surface is $0/-0.05$ mm
2. For NNTR, the diameter tolerance is h10
3. For NATR, NATV, NUTR, PWTR... -2RS, the width tolerance B is h12
4. For stud type track rollers, the tolerance of the support bolt shaft diameter is h7, and the tolerance of the eccentric locking collar is h9.

Design and Use

Internal radial clearance

The internal radial clearance of bearings approximately corresponds to the C2 group in DIN 620-4, and that for STO and NA22...-2RSR corresponds to CN group.

Inner diameter d mm		Internal radial clearance							
		C2 um		CN um		C3 um		C4 um	
Higher than	To	min.	max.	min.	max.	min.	max.	min.	max.

Product Description - Combined Bearings

THB Combined Bearings

Product characteristics

The composite raceway structure design can benefit clients with reduced design and use costs, which can be fitted with the high-rigidity track that can withstand high radial and axial loads to provide high dynamic and static load carrying capacity. The load-carrying capacity could be uniformly distributed on the guide to increase the service lives of the bearing and track, which can be assembled directly by welding bolts in an economic and convenient way. The bearing can be easily replaced so that it is widely used in mechanical, lifting and handling facilities.

Lubrication

THB combined bearings without re-lubrication holes are of fully enclosed construction and are fully filled with grease at the factory. This may ensure the normal use cycle of the bearings.

In the ordinary indoor environment such as in warehouses and plants, the surface of the rollers shall only be applied with protective lubrication oil every six months. To prolong the service life, THB combined bearings can generally be re-lubricated, and the relubrication hole will be plugged with M6 thread plug at the factory.

Under special conditions exposed to high dust, heavy pollution, high humidity, outdoor conditions, temperatures over 40°C, frequent load changes (continuous operation) and heavy loads, the combined bearings should be lubricated at least once a month. #3 grease is recommended to lubricate the THB bearings (such as Shell GadusS2 V100 3). Guide rails should be coated with an appropriate amount of grease for protection during operation.

For THB bearings with diameter of less than 100mm, all bearing components must be disassembled before welding.

For THB bearings with the outer diameter of more than 100mm, they should be welded on both sides of the bolt.

After the bearings have been installed and adjusted, the front screws should be secured with thread adhesive.

To prevent cracks in welded joints, welding rods and core wires for welding non-alloy steel shall be used.

For bearings with the welding diameter of lower than 100mm, all bearing components must be disassembled.

Tolerance

The tolerance shall comply with DIN620. For other unspecified dimensions, ISO 2768-m shall prevail.

Accuracy level: Generally, the accuracy shall reach level P0, and if you have any special requirements, please contact THB technical department.

Rated load and service life: ISO 76 and ISO 281.

Specification of THB Combined Bearings

Outer ring: Surface hardened steel, UNI 16CrNi4 or GB 20CrMnTi, the surface hardness is HRC60±2 after heat treatment. Inner ring: bearing steel, En 31-SAE 52100 or GB GCr15, the hardness is HRC60±2 after heat treatment. Rolling elements: Bearing steel, En 31-SAE 52100 or GB GCr15, the hardness is HRC62±2 after heat treatment.

Block: C22E or steel 20, annealed to facilitate welding

Support frame: C45 or steel 45, tempered

Bolt tolerance -0.05mm

Ordinary products can be re-lubricated

The working temperature of THB combined bearings is from -20 °C to +80 °C.

If you need products that can work at high temperatures, please contact THB technical department.

The maximum linear speed of steel THB combined bearings is 3m/s.

1) Bearing with radius of curvature R=500mm and clearance seal

2) Bearing with plastic flat washer and optimized KIS contour

Permissible range of operating temperature: -30 °C ~ +100 °C (continuous operation)

1) Press-fit lube nozzle to be separately packed for delivery Only supplied lube nozzle to be allowed

2) Nominal dimension of inner hexagonal hole Centralized lube adapter to the central lube system

3) Relubrication hole available at the flange endface only, where a long slot used for rotation resistance is provided at installation

4) Inner hexagonal hole available at the flange endface only No relubrication unit

1) Press-fit lube nozzle to be separately packed for delivery Only supplied lube nozzle to be allowed

2) Nominal dimension of inner hexagonal hole Centralized lube adapter to the central lube system

3) Relubrication hole available at the flange endface only, where a long slot used for rotation resistance is provided at installation

4) Inner hexagonal hole available at the flange endface only No relubrication unit
